diagnostic pathology of infectious disease presents a comprehensive organ based approach to the effective and accurate diagnosis of infectious diseases. Dr. Richard L. Kradin covers the latest information on H1N1 as well as the use of immunohistochemical stains, PCR, immunoperoxidase, and other molecular techniques for a current representation of the field. High quality full color illustrations and differential diagnosis tables accompany each lesion so you can quickly identify and diagnose whatever you see. This reference is an invaluable tool for the accurate diagnosis of any infectious disease. From the common to the most challenging, it covers the latest techniques in immunohistochemistry and molecular genetics, integrated throughout the text for comprehensive information on all investigative contexts relevant to ensuring diagnostic accuracy. It emphasizes the host responses critical in differential diagnosis, serving as a second opinion when non-infectious diagnoses mimic and confound the diagnosis of infection. Provides a complete visual guide to suspect lesions through superb high quality full color illustrations of key aspects of various diseases that facilitate the rapid identification of biopsy specimen. Contents organized by organ as opposed to pathogen to more effectively address diagnostic and management issues. Features tables that list differential diagnosis for each lesion for quick summaries of key points in problem areas. Highlights morphological characteristics and landmarks of tissue samples throughout the text for easy access to information necessary for signing out specimen. Focuses on clinicopathologic features and correlations so you can deal with the diagnostic problems you face every day.

an outbreak of a respiratory disease first reported in Wuhan, China in December 2019 and the causative agent was discovered in January 2020 to be a novel beta-coronovirus of the same subgenus as SARS-CoV and named Severe Acute Respiratory Syndrome Coronavirus 2 (SARS-CoV-2). Coronavirus disease 2019 (COVID-19) has rapidly disseminated worldwide with clinical manifestations ranging from mild respiratory symptoms to severe pneumonia and a mortality rate estimated around 2%. Person-to-person transmission is occurring both in the community and healthcare settings. The World Health Organization (WHO) has recently declared the COVID-19 epidemic a public health emergency of international concern. The ongoing outbreak presents many clinical and public health management challenges due to limited understanding of viral pathogenesis, risk factors for infection, natural history of disease, including clinical presentation and outcomes, prognostic factors for severe illness, period of infectivity, modes and extent of virus interhuman transmission as well as effective preventive measures and public health response and containment interventions. There are no antiviral treatment nor vaccine available but fast-track research and development efforts including clinical therapeutic trials are ongoing across the world managing this serious epidemic requires the appropriate deployment of limited human resources across all cadres of health care and public health staff including clinical laboratory managerial and epidemiological data analysis and risk assessment experts. It presents challenges around public communication and messaging around risk with the potential for misinformation and disinformation. Therefore, integrated operational research and intervention learning from experiences across different fields and settings should contribute towards better understanding and managing COVID-19. This research topic aims to highlight interdisciplinary research approaches deployed during the COVID-19 epidemic addressing knowledge gaps and generating evidence for its improved management and control. It will incorporate critical theoretically informed and empirically grounded original research contributions using diverse approaches, experimental observational and intervention studies, conceptual framing, expert opinions, and reviews from across the world. The research topic proposes a multidimensional approach to improving the management of COVID-19 with scientific contributions from all areas of virology, immunology, clinical microbiology, epidemiology, therapeutics, communications as well as infection prevention and public health risk assessment and management studies.
